3. The following is an examiner's statement of reasons for allowance: matter: none of the prior art of the record discloses a symbol timing recovery circuit comprising: a selection circuit is electrically coupled with the transform value generation circuit to receive the transform value output from the transform value generation circuit and to output the transform value according to the order of the sampling point, a plurality of accumulators for receiving the transform value of a corresponding sampling point output from the selection circuit, a comparison module is electrically coupled with the plurality of accumulators for comparing the accumulated values to obtain a maximum accumulated value as recited in claims 1, 16,; a plurality of delay circuits connected together in series with a first delay circuit and the last delay circuit electrically connected to the operation circuit, the transform value of each sampling point from the delay circuit being added at the corresponding time in each symbol cycle, and accumulated value by summing over the transform values of summing point being output by the delay circuits respectively after a predetermined time as recited in claims 7, 22, and summing the product of the in-phase signal components of any two consecutive symbols and the product of the quadrature signal components of the same two consecutive symbols to obtain a first transform component, taking the difference between the product of the in-

phase signal component of a previous symbol and the quadrature signal component of a current symbol in any two consecutive symbols and the product of the in-phase signal component of the current symbol and the quadrature signal component of the previous symbol in the same two consecutive symbols to obtain a second transform component as recited in claims 13.
